

# Creating a table and loading data in Amazon DynamoDB

## Overview

In this lab, you will create a simple table in DynamoDB to store information about the employees of a company, including their names, roles and number of years spent in this specific organization.

## Topics covered

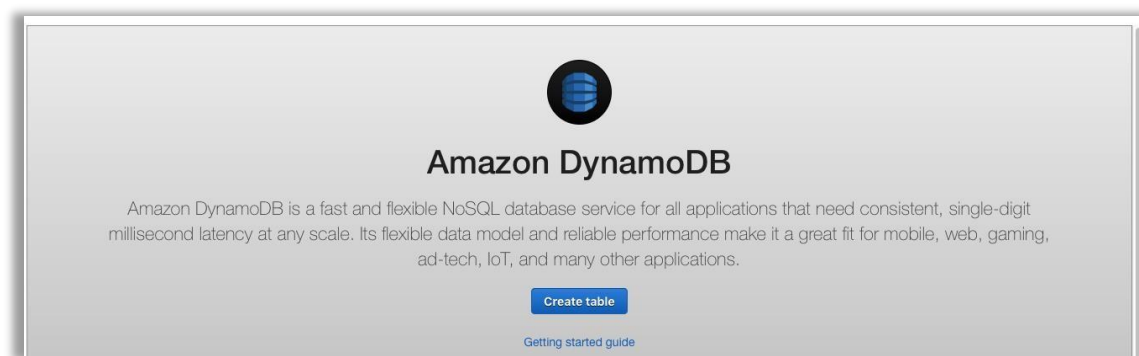

This lab will cover:

- Creating a DynamoDB table
- Loading data in a DynamoDB table

## Creating a new table

In this procedure, you will create a new table named [CompanyEmployeeList](#).

1. In the AWS Management Console, click [DynamoDB](#) located within [Database](#) section.
2. Click [Create Table](#).

3. In the [Table Name](#) box, type [CompanyEmployeeList](#).
4. For [Primary Key](#), type [EmployeeName](#) and select [String](#).

5. Click [Add Sort Key](#) and in the new field type [Role](#) and leave [String](#) selected.
6. In the [Table Settings](#) page, leave [Use default settings](#) selected and click [Create](#).

### [Adding and Modifying Table Data](#)

In this procedure, you will add data to the CompanyEmployeeList table.

7. With the CompanyEmployeeList table selected, click the [Items](#) tab.
8. Click [Create Item](#).
9. Type in the string values for [EmployeeName](#) and [Role](#) attributes.
10. Create an additional attribute: click the plus sign to the left of the last attribute and then click [Append](#).
11. In the drop-down list select the [Number](#) type and a new attribute row will be added.
12. In the [Field](#) box, enter [Years](#)

13. In the [Value](#) box, enter number of years.

14. Click [Save](#) to store the new item with its three attributes.

15. Now create two more items, repeating the steps above, starting with [Create Item](#), and editing/adding the attributes.

16. [Conclusion](#): Congratulations! You have now successfully:

Created an Amazon DynamoDB table.

Loaded data into an Amazon DynamoDB table.
