Project 1

Scenario:

Your development team needs you to create a small Linux instance for testing a new application. You have to create the EC2 instance per their defined specifications.

A few days later, the development team informs you that they want to move the instance into production. But before they do that, they want you to change the specifications of the instance.

Goals of the project:

- Create an EC2 instance with the following specifications:
  - AMI: Amazon Linux
  - Instance Type: T2.nano
  - Volume Type: 8GB Magnetic
- Reconfigure the instance to achieve the following specification:
  - Instance Type: Scale to a T2.small
  - Volume Type: Increase to 12GB General Purpose SSD
- Verify whether the root volume on the EC2 instance is displaying the correct size.
